“Raman studies of 2D magnets CrI₃ and MnPSe₃”

The discovery of 2-dimensional (2D) materials, such as CrI₃, that retain magnetic ordering at few-layers and monolayer thicknesses has resulted in a surge of both pure and applied research in 2D magnetism. I will present magneto-Raman spectroscopy studies on multilayered CrI₃ and single crystalline MnPSe₃. We find a strong sensitivity of phonon excitations to the magnetic order in CrI₃ and a hybridization between magnon and phonons in MnPSe₃. The strong magnon-phonon coupling reported here highlights the need to understand its effects on spin transport experiments in magnetic vdW materials.
